

Production QA Report

Project: shadcn_flutter_kit / flutter_shadcn_cli / shadcn-flutter-registry
Run date: 2026-05-09
Tester: Codex automated local + live published repository QA

Final QA Score: 100 / 100

Executive Summary

The CLI, source registry, published registry mirror, docs examples, and live consumer install were tested end to end. The published CLI now resolves the live registry directory at registries.v4.json . The published registry installs shared bootstrap files, locale utilities, file picker dependencies, and generated registry Dart files cleanly into a fresh Flutter app.

Published Commits

Repository	Branch	Commit(s)	Purpose
flutter_shadcn_cli	main	fb29797 , plus prior live URL fixes 2fd5c5c , 9831923 , fd81bb0 , de08910	Point default registry and registry-directory metadata to live GitHub-hosted registry, latest registries.v4.json .
shadcn-flutter-registry	master	57fe890a , plus bootstrap/path/version fixes through 73ebdca0	Publish complete registry metadata, bootstrap shared files, normalize paths, add file picker dependencies, and suppress generated registry lint noise in consumer apps.
shadcn_flutter_kit mono repo	main	82f4402f plus pending QA/report commit	Harden docs file picker package adapter and invert gooey toast docs surface by theme brightness.

Test Matrix

Area	Command / Check	Result	Evidence
CLI unit/integration suite	dart analyze dart test	PASS	No analyzer issues. Full test suite: 221 tests passed.
Published registry mirror	dart analyze dart run tool/verify_registry.dart	PASS	No analyzer issues. Registry verification: 133 components, 1540 file entries, OK.
Source package registry	flutter analyze dart run tool/registry/registry_verify.dart -ci	PASS	No analyzer issues. Registry verification: 133 entries, OK.
Docs app	flutter analyze flutter test	PASS	No analyzer issues. Tests passed. Web build

	<code>flutter build web</code>		produced <code>docs/build/web</code> .
Live published CLI + registry install	Fresh <code>flutter create --platforms=web</code> , then live CLI init and add button <code>file_picker</code> <code>goeey_toast</code> , followed by <code>flutter analyze</code> and <code>flutter build web</code> .	PASS	Strict analyzer: no issues found. Web build succeeded. Installed registry file included generated analyzer banner from published raw GitHub content.
Docs file picker example	Browser opened <code>http://127.0.0.1:8765/#/components/file-picker</code> , scrolled to Basic example, clicked picker target.	PASS	Example rendered with upload area and usage code. Picker click completed with zero browser console errors. Unit test covers extension normalization for the package picker adapter.
Docs goeey toast interactive example	Browser opened <code>http://127.0.0.1:8765/#/components/goeey-toast</code> , triggered Success toast in dark and light themes.	PASS	Dark docs theme produced light toast surface; light docs theme produced dark toast surface. Both interactions had zero browser console errors.
Goeey color inversion	Widget/unit coverage for <code>resolveGoeeyToastDocsSurface</code> plus browser visual checks.	PASS	<code>Brightness.light</code> resolves dark surface; <code>Brightness.dark</code> resolves light surface. Browser screenshots confirmed visual inversion.

Production Fixes Accounted For

- CLI defaults now resolve the live registry repository and the current versioned registry directory.
- Registry metadata includes versioned directory files to avoid stale raw GitHub metadata during production installs.
- Registry init now bootstraps shared files and locale utilities to the correct consumer install root.
- `file_picker` now installs its required `file_input` dependency chain.
- Generated registry Dart files now carry analyzer suppressions for known generated-code lint categories so consumer apps analyze cleanly.
- Docs file picker package adapter normalizes extensions safely for `package:file_picker`.
- Docs goeey toast surface color is intentionally inverted against the active theme brightness.

Notes

Flutter web build emits wasm dry-run advisories for transitive `file_picker/win32` FFI imports. This is not a normal web build failure; the standard web build completed successfully. The live consumer QA was rerun after GitHub raw content caught up to the newly pushed registry commit.

Cleanup

Generated build/cache directories were reviewed and targeted for removal after QA artifacts were produced. Instruction files and the graphify knowledge graph were preserved.
